

PATENT

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re the application of:

Fischetti, et al.

Serial No. continuation of 09/654,482

Group: 1616

Filed: September 28, 2000

Examiner: Raj Bawa, Ph.D.

The Honorable Commissioner of  
Patents and Trademarks  
Washington, D.C. 20231

**PRELIMINARY AMENDMENT**

Sir:

Please note that all correspondence should go to the address of the undersigned attorney, said address being:

2120 L Street, N.W.  
Suite 210  
Washington, D.C. 20037

**IN THE TITLE**

Please cancel the title and replace it with the following:

-- A Composition for Treatment of a Bacterial Infection of the Digestive Tract--:

**IN THE SPECIFICATION**

Page 1, the paragraph starting at line 5, should be changed as follows:

The following application is a continuation of 09/654,482, filed September 1, 2000, which

is a continuation- in- part of 09/497,495 filed April 18, 2000 which is a continuation of 09/395,636 filed September 14, [2000] 1999, now U.S. Patent No. 6,056,954 which is a continuation- in- part of U.S. Patent Application 08/962,523, filed October 31, 1997, now U.S. Patent No. 5,997,862.

Page 1, the paragraph containing lines 21-22 and beginning at line 20 should be changed as follows:

In the past, antibiotics have been used to treat various infections. The work of Selman Waksman in the introduction and production of Streptomyces[,] and Dr. Fleming's discovery of penicillin, [are well known] as well as the work of numerous others in the field of antibiotics , are well known. Over the years, there have been additions and chemical modifications to the "basic" antibiotics in attempts to make them more powerful, or to treat people allergic to these antibiotics.

Page 2, the paragraph containing line 2 and beginning at line 1 should be changed as follows:.

Others have found new uses for these antibiotics. U.S. Patent No. 5,260,292 (Robinson et al.) discloses [the] a topical treatment of acne with aminopenicillins. The method and composition for topically treating acne and acneiform dermal disorders includes applying an amount of an antibiotic selected from the group consisting of ampicillin, amoxicillin, other aminopenicillins, and cephalosporins, and derivatives and analogs thereof, effective to treat the acne and acneiform dermal disorders. U.S. Patent No. 5,409,917 (Robinson et al.) discloses the topical treatment of acne with cephalosporins.

Page 2, the paragraph containing lines 15 and 16 and beginning at line 8 should be changed as follows:

However, as more antibiotics have been prescribed or used at an ever increasing rate for a variety of illnesses, increasing numbers of bacteria have developed a resistance to antibiotics. Larger doses of stronger antibiotics are now being used to treat ever more resistant strains of bacteria. Multiple antibiotic resistant bacteria have consequently developed. The use of more antibiotics and the number of bacteria showing resistance has led to increasing the amount of time that the antibiotics need to be used. Broad, non-specific antibiotics, some of which have detrimental effects on the patient, are now being used more frequently. Also, antibiotics do not easily penetrate mucus linings. Additionally, the number of people allergic to antibiotics appears to be increasing.

[Additionally, the number of people allergic to antibiotics appears to be increasing.]

The paragraph on page 2, beginning at line 18, should be changed as follows::

Attempts have been made to treat bacterial diseases [with] by the use of bacteriophages. U.S. Patent No. 5,688,501 (Merril, et al.) discloses a method for treating an infectious disease caused by bacteria in an animal with lytic or non-lytic bacteriophages that are specific for particular bacteria.

Page 3, please change the paragraph containing line 4, and beginning at line 2, as follow:

It is to be noted that the direct introduction of bacteriophages into an animal to prevent or fight diseases has certain drawbacks. Specifically, the bacteria must be in the right growth phase for the phage to attach. Both the bacteria and the [and the] phage have to be in the correct and synchronized growth cycles. Additionally, there must be the right number of phages to attach to the bacteria; if there are too many or too few phages, there will either be no attachment or no production of the lysing enzyme. The phage must also be active enough. The phages are also inhibited by many things including bacterial debris from the organism it is going to attack. Further complicating the direct use of bacteriophage to treat bacterial infections is the possibility of immunological reactions, rendering the phage non-functional.

Page 3, please change the paragraph containing (and beginning at ) line 11 to:

Consequently, others have explored the use [other] of safer and more effective means to treat and prevent bacterial infections.

Page 3, please change the paragraph containing line 14 and beginning at line 13 to :

U.S. Patent No. 5,604,109 (Fischetti et al.) relates to the rapid detection of Group A [streptococci] Streptococci in clinical specimens, through the enzymatic digestion by a semi-purified Group C streptococcal phage associated lysin enzyme. The lytic enzyme of this patent is used in U.S. Patent No. 5,997,862 (Fischetti, et. al.), U.S. Patent No. 5,985,271, (Fischetti et al.) and U.S. Patent No. 6,017,528(Fischetti et al.) which disclose the use of an oral delivery mode, such as a

candy, chewing gum, lozenge, troche, tablet, a powder, an aerosol, a liquid or a liquid spray, containing a lysin enzyme produced by group C streptococcal bacteria infected with a C1 bacteriophage for the prophylactic and therapeutic treatment of Streptococcal A throat infections, commonly known as strep throat.

Page 4, please change the paragraph containing line 8 and beginning at line 6 to—

The method for obtaining and purifying the lytic enzyme produced by a bacteria infected with the bacteriophage is known in the art. Some recent evidence suggests that the phage enzyme that lyses the [streptococcus] *Streptococcus* organism may actually be a bacterial enzyme that is used to construct the cell wall and the phage. While replicating in the bacterium, a phage gene product may cause the upregulation or derepression of bacterial enzyme for the purpose of releasing the bacteriophage. These bacterial enzymes may be tightly regulated by the bacterial cell and are used by the bacteria for the construction and assembly of the cell wall.

Page 5, please change the paragraph beginning at line 18 to:

In one embodiment of the invention, the prophylactic and therapeutic treatment of a variety of illnesses caused by *Streptococcal pneumoniae*, *Streptococcus fasciae*, and *Hemophilus influenza* are disclosed. In another embodiment of the invention, gram negative bacterial infections caused by *Listeria*, *Salmonella*, *E. coli*, and *Campylobacter*, are treated by the use of lytic enzymes. These and other bacteria, which can infect the digestive system, can be treated by incorporating the lytic

enzymes in suppository enemas, in syrups, or in other carriers to [get] go directly to the site of the infection(s).

Page 6, please change the paragraph beginning at line 7 to

Vaginal infections caused by Group B Streptococcus can cause premature [birth] births and subsequent complications resulting in neonatal sepsis. Lysin incorporated into tampons specific for group B strep would prevent [infection] infections of the neonate during birth without disturbing normal vaginal flora so that women would not be overcome by yeast infection as a result of antibiotic therapy.

Page 6, the paragraph containing and beginning at line 12 should be changed to:

In another embodiment of the invention, eye drops containing lytic enzymes of [Hemophilus] Hemophilus, Pseudomonas, and/or Staphylococcus can be used to directly treat eye infections. Treatment with lytic enzymes are faster and more expedient than with antibiotics.

Page 6, the paragraph containing line 21 and beginning at line 18 should be changed to:

In another embodiment of the invention the lytic enzyme is administered in the form of a candy, chewing gum, lozenge, troche, tablet, a powder, an aerosol, a liquid, a liquid spray, or toothpaste for the prevention or treatment of bacterial infections associated with upper respiratory

tract illnesses[.].

Page 7, the paragraph containing line 4 and beginning at line 1 should be changed to:

In another embodiment of the invention, species specific lytic enzymes can be used in the treatment of bacterial infections associated with topical or dermatological infections, administered in the form of a topical ointment or cream. In another embodiment of the invention, the lytic enzyme would be administered in an aqueous form. In yet another embodiment of the invention, lysostaphin, the enzyme which lyses [Staphylococcus aureus] Staphylococcus aureus, can be included in the therapeutic agent. In a further embodiment of the invention, conventional antibiotics may be included in the therapeutic agent with the lytic enzyme, and with or without the presence of lysostaphin. More than one lytic enzyme may also be included in the prophylactic or therapeutic agent.

Page 7, the paragraph beginning at line 14, and containing line 17 should be changed to:

The method for treating bacterial infections comprises treating the infection with a therapeutic agent comprising an effective amount of at least one lytic enzyme produced by a bacteria infected with a bacteriophage specific for the bacteria. [The] The lytic enzyme is preferably in an environment having a pH which allows for activity of [said] the lytic enzyme.

Page 7, the paragraph containing line 20 and beginning at line 18 should be changed to:

The lytic enzyme can be used for the treatment or prevention of Hemophilus [influenza] influenza, Pseudomonas, Streptococcus pneumoniae, Streptococcus fasciae, Streptococcus group B, Listeria, Salmonella, E. coli, Campylobacter, [and] other bacteria, and any combination thereof.

Page 13, the paragraph containing line 19 and beginning on line 17 should be changed to:

Another use of a lytic enzyme is for the treatment of bacterial infections of the digestive tract. The method for treating a bacterial infection of the digestive tract comprises treating the bacterial infection with a composition comprising an effective amount of at least one lytic enzyme produced by a bacteria infected with a bacteriophage specific for the bacteria, and a carrier for delivering said lytic enzyme to the digestive tract. In a preferred embodiment of the invention, the bacterial infections being treated are being caused by gram negative bacteria selected from the group consisting of Listeria, Salmonella, E. coli, and Campylobacter. However, this method and composition will effectively treat other bacteria, when the appropriate lytic enzyme is used.

Page 20, the paragraph containing line 17 should be changed to

The effective dosage rates or amounts of the lytic enzyme to treat the infection, and the duration of treatment will depend in part on the seriousness of the infection, the duration of exposure of the recipient to the infectious bacteria, the number of square centimeters of skin or tissue which are infected, the depth of the infection, the seriousness of the infection, and a variety of a number of other variables. The composition may be applied anywhere from once to several times

20220346007  
a day, and may be applied for a short or long term period. The usage may last for days or weeks. Any dosage form employed should provide for a minimum number of units for a minimum amount of time. The concentration of the active units of enzyme believed to provide for an effective amount or dosage of enzyme may be in the range of about 100 units/ml to about 500,000 units/ml of composition, preferably in the range of about 1000 units/ml to about 100,000 units/ml, and most preferably from about 10,000 to 100,000 units/ml. The amount of active units per ml and the duration of time of exposure depends on the nature of infection, and the amount of contact the carrier allows the lytic enzyme to have. It is to be remembered that the enzyme works best when in a fluid environment. Hence, effectiveness of the enzyme is in part related to the amount of moisture trapped by the carrier. In another preferred embodiment, a mild surfactant is present in an amount effective to potentiate the therapeutic effect of the lytic enzyme. Suitable mild surfactants include, inter alia, esters of polyoxyethylene sorbitan and fatty acids (Tween series), octylphenoxy polyethoxy ethanol (Triton-X series), n-Octyl-.beta.-D-glucopyranoside, n-Octyl-.beta.-D-thioglucopyranoside, n-Decyl-.beta.-D-glucopyranoside, n-Dodecyl-.beta.-D-glucopyranoside, and biologically occurring surfactants, e.g., fatty acids, glycerides, monoglycerides, deoxycholate and esters of deoxycholate.

Page 25, line 2, the paragraph beginning with line 1, should be changed to:

It is also to be remembered that a carrier may have more than one lytic enzyme. For instance, [A] a throat lozenge may comprise just a lysin enzyme (which lyses the Streptococcus A strain causing "strep" throat, or it may also include the lytic enzymes for Hemophilus. Similarly, the carrier for treating burns and wounds, or infections of the skin, may contain just one lytic enzyme,

or a combination of lytic enzymes, for the treatment of Pseudomonas, Streptococcus, Staphylococcus, or any other of a number of bacteria.

#### IN THE CLAIMS

Please amend claim 1 as follows:

Please cancel claims 1-14.

Please add the following claims:

15) A suppository enema for treating bacterial infections of the digestive tract, wherein said suppository enema is produced by the method of:

a) obtaining at least an effective amount of at least one lytic enzyme genetically coded for by a bacteriophage specific for a bacteria that causes said bacterial infections of said digestive tract, said at least one lytic enzyme has the ability to digest a cell wall of a specific said bacteria, said bacteria being selected from the group consisting of *Listeria*, *Salmonella*, *E. coli*, *Campylobacter*, and combinations thereof; and,

b) mixing said at least one lytic enzyme produced in step (a) with a carrier for delivering said enzyme to said digestive tract.

16) The composition according to claim 15, wherein said composition further comprises a buffer that maintains pH of a composition a range between about 4.0 and about 9.0.

17) The composition according to claim 16, wherein the buffer maintains the pH of the composition at the range between 5.5 and 7.5.

18) The composition according to claim 18, wherein said buffer comprises a reducing reagent.

19) The composition according to claim 20, wherein said reducing reagent is dithiothreitol.

20) The composition according to claim 20, wherein said buffer comprises a metal chelating reagent.

21) The composition according to claim 22, wherein said metal chelating reagent is ethylenediaminetetracetic disodium salt.

22) The composition according to claim 20, wherein said buffer is a citrate-phosphate buffer.

23) The composition according to claim 15, further comprising a bactericidal or bacteriostatic agent as a preservative.

24) The composition according to claim 15, wherein said at least one lytic enzyme is lyophilized.

25). The composition according claim 15, wherein said at least one lytic enzyme is present in a concentration of about 100 to about 100,000 active enzyme units per milliliter of fluid in the wet environment of the digestive tract

26). The composition according to claim 27, wherein said at least one lytic enzyme is present in a concentration of about 100 to about 10,000 active enzyme units per milliliter of fluid in the wet environment of the digestive tract.

#### REMARKS

Please cancel claims 1-14 and add claims 15- 26, with 1 independent claim.

The new claims differentiate the present invention by

- 1) being specific for specific bacteria which inhabit the digestive tract;
- 2) specifically stating that the carrier is directed towards delivering the enzyme(s) specifically to the digestive tract; this is the nature of the carrier, not merely its function;
- 3) defining the very structure of the enzyme by its production and by its specific nature, something Schmitt does not teach or disclose. Schmitt is directed to a lytic enzyme which is non-specific and which does not disclose, as part of the composition, a carrier for getting the enzyme to the digestive tract. This is an important part of the invention.

The application is now in condition for allowance. Please call the undersigned at (301) 603-9071 if you have any questions or comments. Thank you.

Very truly yours,

Jonathan E. Grant

Reg. No. 34,830

Washington, D.C. 20037

**APPENDIX - CLEAN COPY OF SPECIFICATION PARAGRAPHS**

**IN THE SPECIFICATION**

Page 1, the paragraph starting at line 5, should be changed as follows:

The following application is a continuation of 09/654,482, filed September 1, 2000, which is a continuation- in- part of 09/497,495 filed April 18, 2000 which is a continuation of 09/395,636 filed September 14, 1999, now U.S. Patent No. 6,056,954 which is a continuation- in- part of U.S. Patent Application 08/962,523, filed October 31, 1997, now U.S. Patent No. 5,997,862.

Page 1, the paragraph containing lines 21-22 and beginning at line 20 should be changed as follows:

In the past, antibiotics have been used to treat various infections. The work of Selman Waksman in the introduction and production of Streptomyces and Dr. Fleming's discovery of

penicillin, as well as the work of numerous others in the field of antibiotics , are well known. Over the years, there have been additions and chemical modifications to the “basic” antibiotics in attempts to make them more powerful, or to treat people allergic to these antibiotics.

Page 2, the paragraph containing line 2 and beginning at line 1 should be changed as follows:

Others have found new uses for these antibiotics. U.S. Patent No. 5,260,292 (Robinson et al.) discloses a topical treatment of acne with aminopenicillins. The method and composition for topically treating acne and acneiform dermal disorders includes applying an amount of an antibiotic selected from the group consisting of ampicillin, amoxicillin, other aminopenicillins, and cephalosporins, and derivatives and analogs thereof, effective to treat the acne and acneiform dermal disorders. U.S. Patent No. 5,409,917 (Robinson et al.) discloses the topical treatment of acne with cephalosporins.

Page 2, the paragraph containing lines 15 and 16 and beginning at line 8 should be changed as follows:

However, as more antibiotics have been prescribed or used at an ever increasing rate for a variety of illnesses, increasing numbers of bacteria have developed a resistance to antibiotics. Larger doses of stronger antibiotics are now being used to treat ever more resistant strains of bacteria. Multiple antibiotic resistant bacteria have consequently developed. The use of more antibiotics and the number of bacteria showing resistance has led to increasing the amount of time that the

antibiotics need to be used. Broad, non-specific antibiotics, some of which have detrimental effects on the patient, are now being used more frequently. Also, antibiotics do not easily penetrate mucus linings. Additionally, the number of people allergic to antibiotics appears to be increasing.

The paragraph on page 2, beginning on line 18, should be changed as follows::

Attempts have been made to treat bacterial diseases by the use of bacteriophages. U.S. Patent No. 5,688,501 (Merril, et al.) discloses a method for treating an infectious disease caused by bacteria in an animal with lytic or non-lytic bacteriophages that are specific for particular bacteria.

Page 3, please change the paragraph containing line 4, and beginning as line 2, as follow:

It is to be noted that the direct introduction of bacteriophages into an animal to prevent or fight diseases has certain drawbacks. Specifically, the bacteria must be in the right growth phase for the phage to attach. Both the bacteria and the phage have to be in the correct and synchronized growth cycles. Additionally, there must be the right number of phages to attach to the bacteria; if there are too many or too few phages, there will either be no attachment or no production of the lysing enzyme. The phage must also be active enough. The phages are also inhibited by many things including bacterial debris from the organism it is going to attack. Further complicating the direct use of bacteriophage to treat bacterial infections is the possibility of immunological reactions, rendering the phage non-functional.

Page 3, please change the paragraph containing (and beginning at ) line 11 to:

Consequently, others have explored the use of safer and more effective means to treat and prevent bacterial infections.

Page 3, please change the paragraph containing line 14 and beginning at line 13 to::

U.S. Patent No. 5,604,109 (Fischetti et al.) relates to the rapid detection of Group A streptococci in clinical specimens, through the enzymatic digestion by a semi-purified Group C streptococcal phage associated lysin enzyme. The lytic enzyme of this patent is used in U.S. Patent No. 5,997,862 (Fischetti, et. al.), U.S. Patent No. 5,985,271, (Fischetti et al.) and U.S. Patent No. 6,017,528(Fischetti et al.) which disclose the use of an oral delivery mode, such as a candy, chewing gum, lozenge, troche, tablet, a powder, an aerosol, a liquid or a liquid spray, containing a lysin enzyme produced by group C streptococcal bacteria infected with a C1 bacteriophage for the prophylactic and therapeutic treatment of Streptococcal A throat infections, commonly known as strep throat.

Page 4, please change the paragraph containing line 8 and beginning at line 6 to--

The method for obtaining and purifying the lytic enzyme produced by a bacteria infected with the bacteriophage is known in the art. Some recent evidence suggests that the phage enzyme that lyses the *Streptococcus* organism may actually be a bacterial enzyme that is used to construct

the cell wall and the phage. While replicating in the bacterium, a phage gene product may cause the upregulation or derepression of bacterial enzyme for the purpose of releasing the bacteriophage. These bacterial enzymes may be tightly regulated by the bacterial cell and are used by the bacteria for the construction and assembly of the cell wall.
